

Object-Oriented Programming and the C++ Language

Hebrew course name: Tichnut Munche Atzamim ve-Safat C++

Lecturer: Keren Kalif | 3 credit points

Course description

An introduction to object-oriented design and its implementation in C++. Covers classes, inheritance, polymorphism, operator overloading, templates, the STL, and manual memory management with RAI and smart pointers.

Grading

Final project: 40% of the course grade.

Midterm examination: 25% of the course grade.

Homework assignments: 35% of the course grade.

A grade of at least 60 in the final project is required to pass the course.

Late submission policy

Five points are deducted from an assignment for each day it is submitted late. Assignments are not accepted more than seven days after the deadline. Extensions are granted only for documented medical or military reserve reasons.

Prerequisites

Students must have completed Introduction to Programming with a passing grade. Data Structures may be taken concurrently but is not required beforehand.

Attendance

Attendance at 80% of lectures is required. Laboratory sessions are mandatory and cannot be made up.

Required reading

Effective C++ by Scott Meyers, third edition.

The C++ Programming Language by Bjarne Stroustrup, fourth edition.

Recommended: Design Patterns by Gamma, Helm, Johnson and Vlissides.

Academic integrity

Collaboration on the design of homework is permitted. Submitted code must be written individually. Shared code between submissions is treated as plagiarism and reported to the disciplinary committee.
